ZOHO CREATOR API INTEGRATION

Hotel Booking Management Application

Project Report
Aim • Procedure • Result

1. Aim

To develop a hotel booking management application in Zoho Creator and demonstrate API integration for reservation data. The application provides a dashboard for viewing booking summaries and a reservation report for reviewing booking details, including reservation code, check-in and check-out dates, number of guests, booking source, and total amount.

2. Procedure

1. Open the hotel booking application created in Zoho Creator.

2. Create or configure the required forms and reports for hotel properties, room inventory, guest profiles, reservations, and invoices.

3. Configure the API integration so reservation information can be exchanged with the connected service or application. Set the required connection, permissions, and field mapping in Zoho Creator.

4. Add reservation records with details such as reservation code, check-in date, check-out date, total guests, booking source, and total amount.

5. Open the Dashboard to review summary cards and synchronization status, including synced, failed, pending, and total records.

6. Open Reservations → All Reservations to verify that booking records appear in the report and that the displayed values match the saved reservation data.

7. Review any failed or pending synchronization entries and correct connection, permission, or field-mapping issues before testing again.

3. Application Screenshots

Figure 1. Dashboard showing booking totals, guest totals, price-per-night summary, total bookings, and API synchronization status.

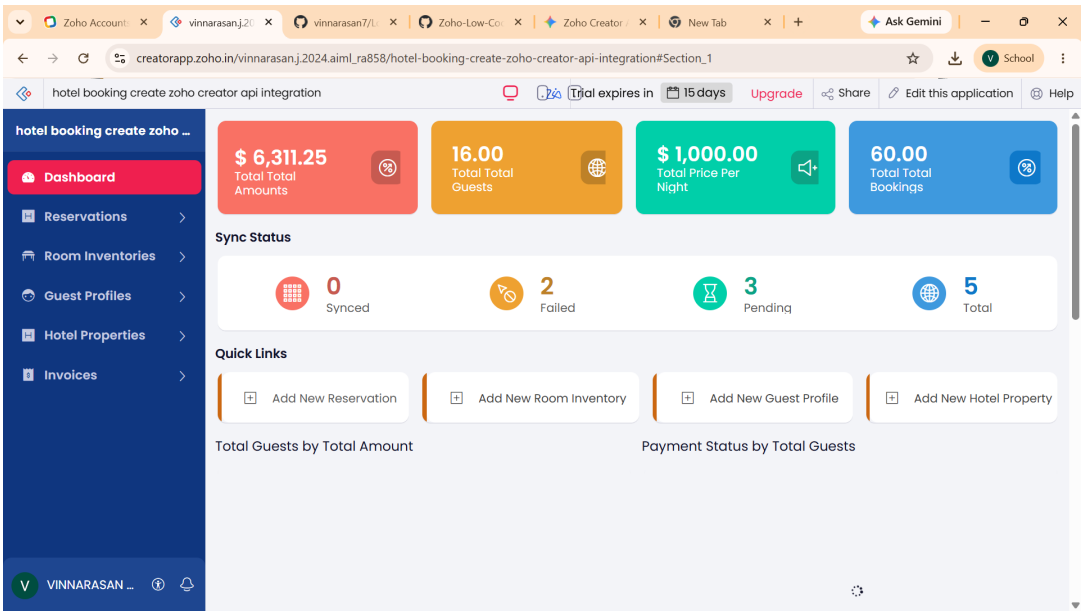

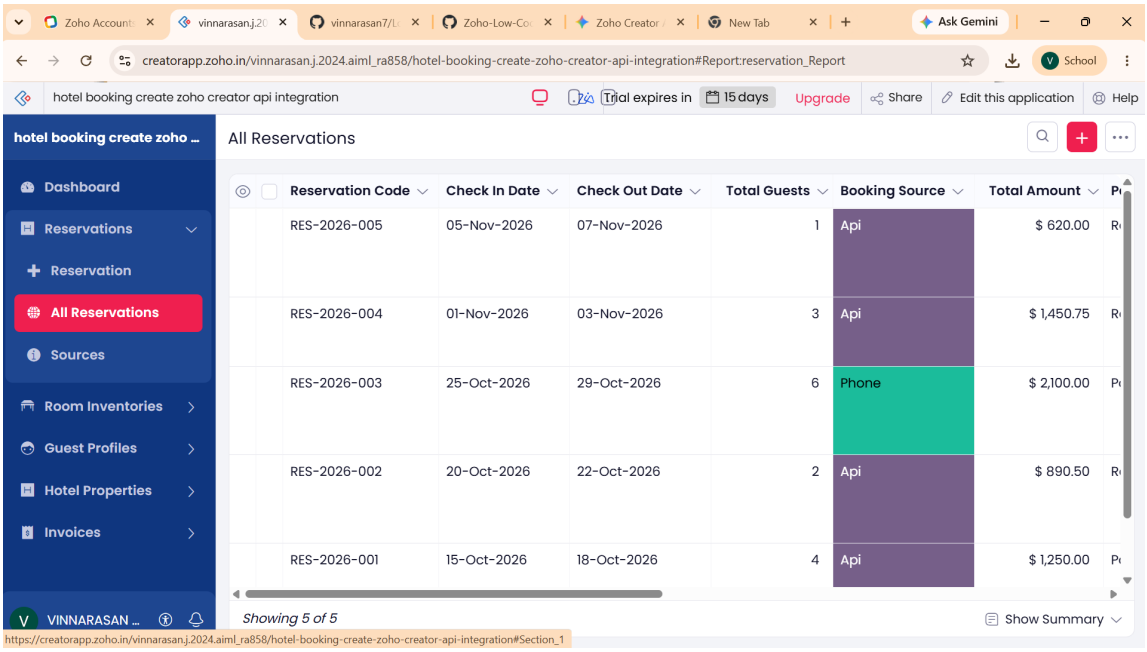

Figure 2. All Reservations report showing reservation codes, check-in and check-out dates, guest counts, booking source, and total amounts.

4. Result

The hotel booking application was demonstrated in Zoho Creator with a dashboard and an All Reservations report. The dashboard displayed summary values of $6,311.25 total amount, 16 total guests, $1,000.00 total price per night, and 60 total bookings. The synchronization summary showed 0 synced, 2 failed, 3 pending, and 5 total records at the time of the screenshot. The reservation report displayed five records, with reservation codes from RES-2026-001 to RES-2026-005 and their booking details.

Therefore, the interface and reservation report were successfully presented. However, the screenshot indicates that API synchronization was not fully successful yet because some records were failed or pending. The integration should be considered fully verified only after the connection is tested and the records synchronize successfully.

5. Conclusion

Zoho Creator can be used to organize hotel booking data and display reservation summaries through reports and dashboards. The screenshots provide evidence of the application interface and saved reservation records. Final validation of the API integration requires resolving the failed and pending sync items and confirming successful data exchange.

Note

This report is prepared from the supplied screenshots. No source code is included. Dashboard figures and sync statuses are reported as they appeared in the screenshots and may change when the application data is updated.
