USER MANAGEMENT AND ROLE-BASED ACCESS CONTROL

AIM, PROCEDURE AND RESULT

AIM

To design and demonstrate a Hotel Booking User Management system that organizes user accounts, access levels, permissions, and user roles. The system helps ensure that users can access only the features and actions permitted for their assigned role.

PROCEDURE

1. Open the application — Launch the Hotel Booking User Management application and view the dashboard.

2. Review the dashboard — Check the summary cards for total amounts, bookings, requests, and user accounts. Review the booking-status summary and charts to understand the current application data.

3. Manage user accounts — Open the User Accounts section. View the available account records and their assigned access levels. Add a new user account when required.

4. Configure access levels — Open Access Levels and review the categories shown, such as Staff, Guest, and Admin. These levels can be used to group users according to their responsibilities.

5. Define access permissions — Open Access Permission and review the available action types, such as Read, Write, and Delete. Review the permissions associated with actions like viewing bookings, editing guest profiles, exporting booking data, and managing payment plans.

6. Create user roles — Open User Roles. Add or review roles and associate suitable permissions with each role. Assign roles based on the tasks a user needs to perform.

7. Verify role-based access — Check that each role has only the permissions required for its work. For example, an administrator may manage accounts and permissions, while a guest should have access only to relevant booking functions. Avoid granting unnecessary write or delete access.

8. Review the results — Return to the dashboard and related lists to confirm that the user-management records, access levels, action types, and roles are displayed as expected.

RESULT

The Hotel Booking User Management application was reviewed successfully. The dashboard displayed booking and user-account summaries, and the application provided sections for managing user accounts, access levels, access permissions, and user roles. The available access levels included Staff, Guest, and Admin, while the permission action types included Read, Write, and Delete. Thus, the application demonstrates the basic organization of users and role-based permissions for controlling access to hotel-booking features.

SCREENSHOTS / EVIDENCE

The following screenshots are included as evidence of the application dashboard, access levels, and permission action types.

Figure 1. Dashboard of the Hotel Booking User Management application.

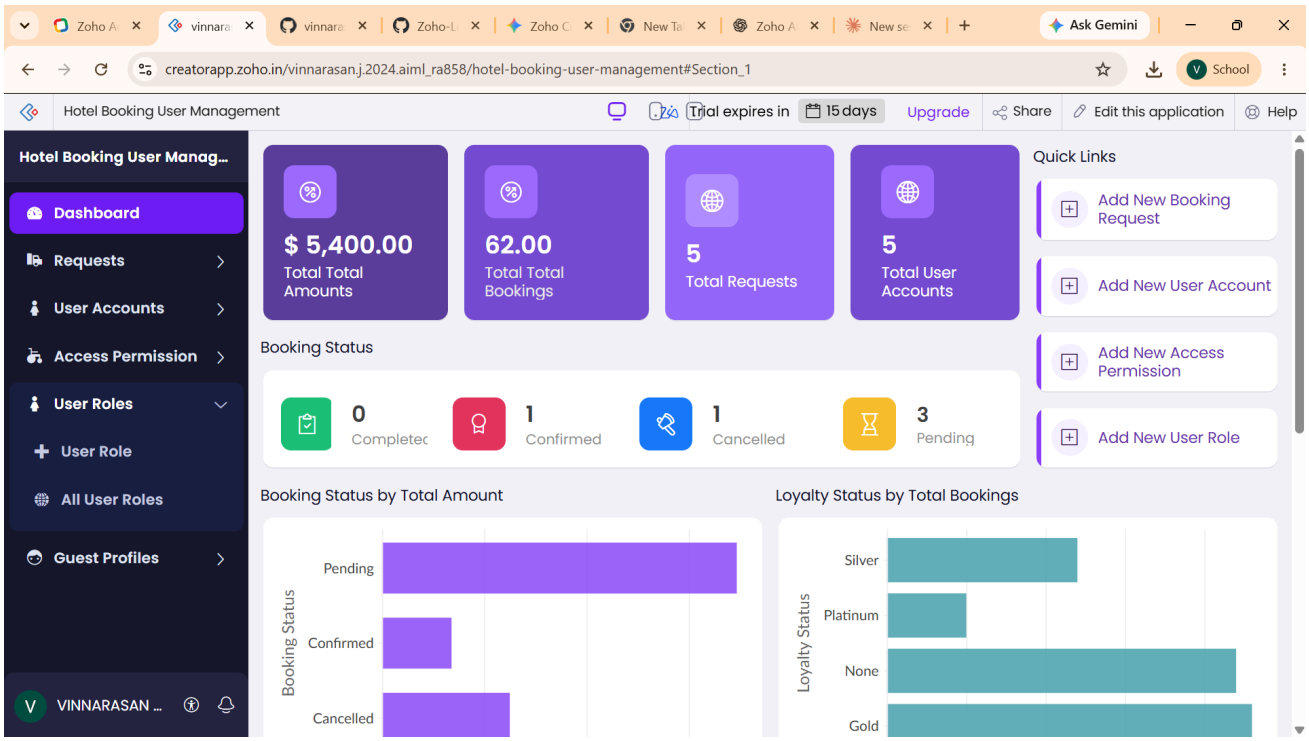

Figure 2. Access Levels grouped as Staff, Guest, and Admin.

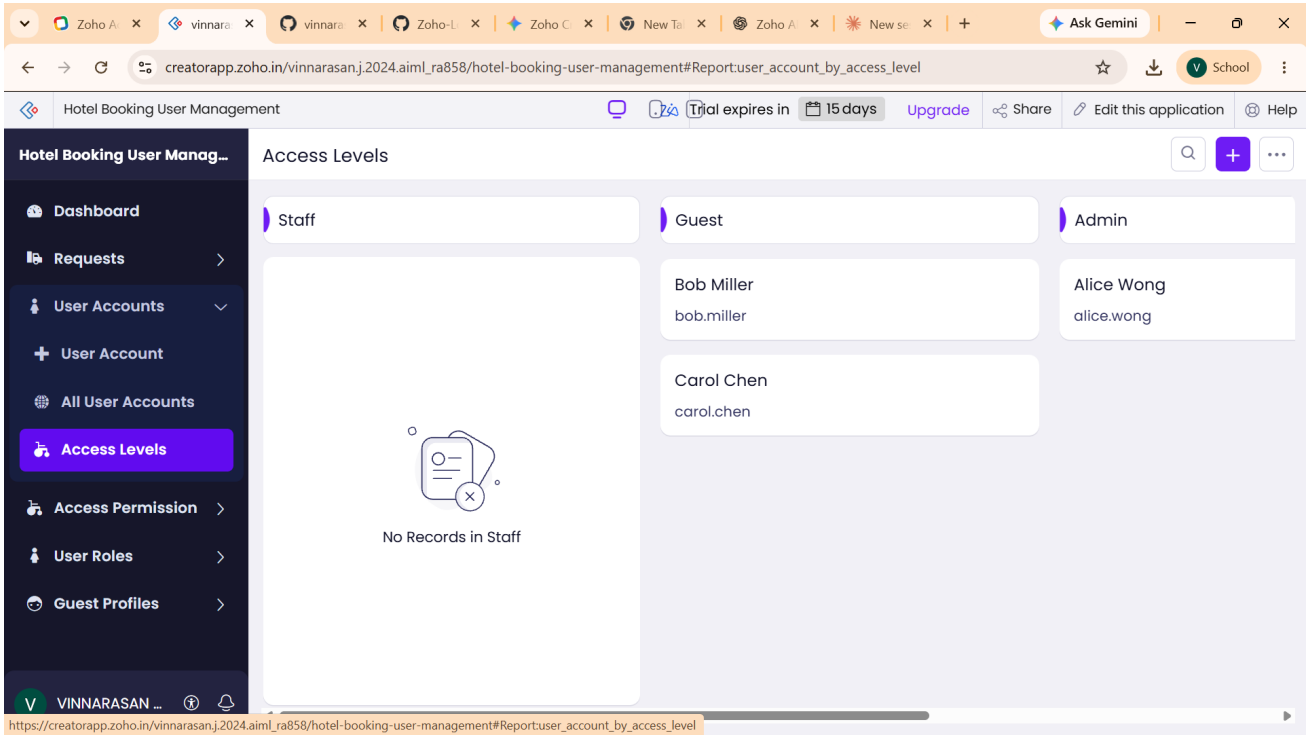

Figure 3. Access Permission Action Types: Read, Write, and Delete.
